

**Square Tube Type Air Cylinder** 15 Series IVI ø32, ø40, ø50, ø63, ø80, ø100

# Increased kinetic energy absorption

The absorption of kinetic energy has been increased by nearly 30% compared to the CA1 series through increased cushion volume and the use of a new cushion seal. In addition, the life of the cushion seal is approximately 5 times longer.

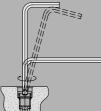

# Improved cushion capacity

Piston rod lurching, due to cracking pressure at start up, has been eliminated by means of a floating seal mechanism.

# Space-saving auto switch mounting

Space is saved by setting switches into grooves provided on 4 surfaces. This is also effective to prevent loosening and damage, etc.

#### **Port aperture** Easy cushion valve adjustment

the cover.

Adjustment of the cushion valve is made with a hexagon wrench key allowing for easy fine adjustment. Furthermore, the cushion valve has been recessed so that it does not protrude from

# Compact and lightweight

The height and width of the covers has been reduced by nearly 10%, and in addition, die-cast covers yield 10 to 25% weight reduction over the CA1 series.

Piston rod sagging reduced

Sagging of the piston rod has been reduced

by increasing the precision of the bushing

and piston rod, and reducing their

clearances.

# Appearance improved by enclosing the tie-rods

Employs a square tube with enclosed tie-rods which is integrated with both covers to achieve an attractive, unified appearance.

# Improved workpiece mounting accuracy

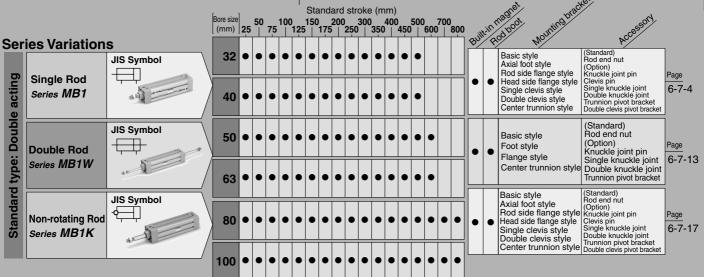

High precision has been achieved in the cylinder unit and the mounting brackets. Improved mounting accuracy simplifies the mounting process

and also extends cvlinder life.

# Dust accumulation can be prevented with fastener strips

Auto switch mounting grooves can be covered with resin fastener strips, which adhere tightly to the tube (option) to prevent the entry and accumulation of dirt.

Series MB1 Specific Product Precautions

Be sure to read before handling.

# Adjustment

# \land Warning

# 1. Do not open the cushion valve beyond the stopper.

Crimping ( $\emptyset$ 32) or a snap ring ( $\emptyset$ 40 to  $\emptyset$ 100) is provided to prevent the accidental removal of the cushion valve. Do not open the valve beyond the mechanism.

If not operated in accordance with the above precautions, the cushion valve may be ejected from the cover when air pressure is supplied.

		MB-63-10-C1250		JIS 4648 Hexagon wrench key 4		

**2. Use the air cushion at the end of cylinder stroke.** When it is intended to use the cushion valve in the fully open position, select the type with damper. If this is not done, the tie-rods or piston rod assembly will be damaged.

3. When replacing mounting bracket, use a hexagon wrench.

# Non-rotating rod type (Double acting, Single rod)

# **Operating Precautions**

# 🗥 Caution

1. Avoid using the air cylinder in such a way that more than allowable rotational torque would be applied to the piston rod.

If rotational torque is applied, the non-rotating guide will deform, thus affecting the non-rotating accuracy.

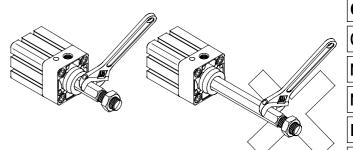

# **Mounting/Piping**

# **▲** Caution

#### 1. Mounting a workpiece on rod end

To screw a bracket or a nut onto the threaded portion at the tip of the piston rod, make sure to retract the piston rod entirely, and place a wrench over the flat portion of the rod that protrudes.

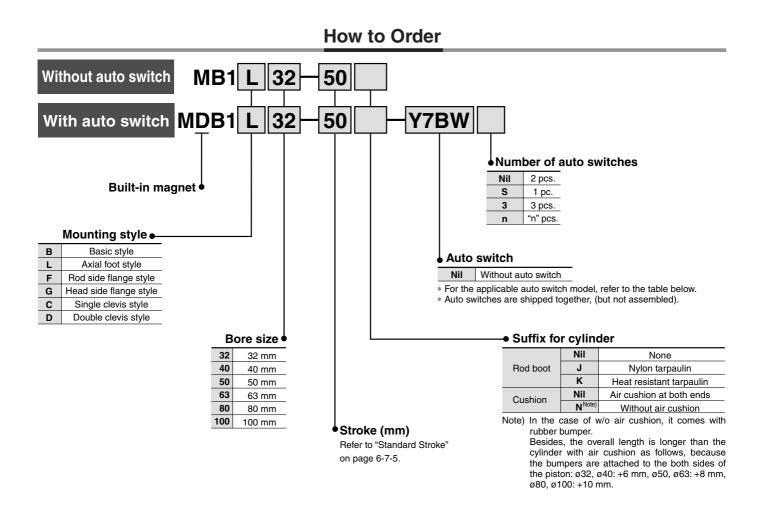

Tighten it by giving consideration to prevent the tightening torque from being applied to the non-rotating guide.

#### **Consideration of the Cushion**

For details about the kinetic energy absorbable by the cushion mechanism and w/ air cushion, refer to page 6-19-5.

## Kinetic Energy Absorbable by the Cushion Mechanism

Bore size (mm)	Effective cushion length (mm)	Kinetic energy absorbable (J)				
32	18.8	2.2				
40	18.8	3.4				
50	21.3	5.9				
63	21.3	11				
80	30.3	20				
100	29.3	29				

With Air Cushion

At the stroke end, when stopping a large amount of kinetic energy generated by a large load and high speed operation, compression of air is used to absorb the impact without transmitting vibration to the surroundings. The purpose of an air cushion is not to reduce the speed of a piston as it nears the stroke end.

The kinetic energy of load can be found using the following formula.

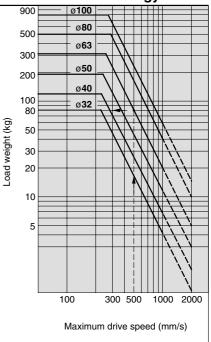

V: Piston speed (m/s)

If the kinetic energy obtained is no greater than the absorbable kinetic energy shown in the table above, the life of the cushion seal will be10 million cycles or more.

#### Allowable Kinetic Energy

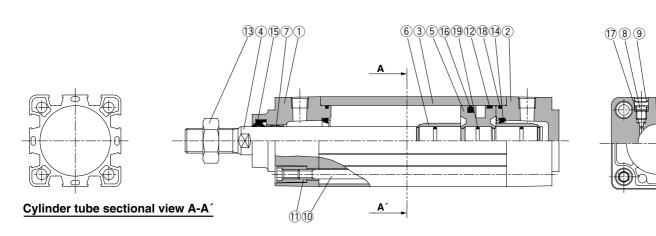

Example) Load limit at rod end when air cylinder ø63 is actuated with max. actuating speed 500 mm/s. at a maximum drive speed of 500 mm/s.

Extend upward from 500 mm/s on the horizontal axis of the graph to the intersection point with the line for a tube bore of 63 mm, and then extend leftward from this point to find the load of 80 kg.

## Water Resistant Air Cylinders

As compared to the standard cylinder, anti-coolant performance has been improved, and suitable for using under the atmosphere having coolant in the machine tools. Improved water resistant air cylinder, Series MB is also available, which is compliant for the environment having water splashed on the food machinery, or car washing machine, etc. Please consult with SMC for details.

# Water Resistant Air Cylinders

As compared to the standard cylinder, anti-coolant performance has been improved, and suitable for using under the atmosphere having coolant in the machine tools. Improved water resistant air cylinder, Series MB is also available, which is compliant for the environment having water splashed on the food machinery, or car washing machine, etc. Please consult with SMC for details.

# Theoretical Output

OUT side is the same value as double acting, single rod. But, IN side is different. For IN side, refer to the table below.

Bore size (mm)	Piston area (mm²)	Bore size (mm)	Piston area (mm²)			
32	675	63	2804			
40	1082	80	4568			
50	1651	100	7223			

Theoretical output (N) = Pressure (MPa) x Piston area (mm<sup>2</sup>)

\* In the case of w/o air cushion, it comes with rubber bumper.

Besides, the overall length is longer than the cylinder with air cushion as follows, because the bumpers are attached to the both sides of the piston: ø32, ø40: +6 mm, ø50, ø63: +8 mm, ø80, ø100: +10 mm.
