
Air-hydro Unit
Series CC

The air-hydro unit consists of a converter and a valve unit that are compactly integrated. It converts air pressure to an equivalent hydraulic pressure, and this hydraulic pressure is used for operating an actuator, thus solving the problem that is associated with the compression characteristics of air. Thus, in spite of using pneumatic equipment, it performs similarly to a hydraulic unit, operating at a constant speed during starting or in the presence of load fluctuations, and at the same time solving the problems of sticking and slipping associated with low speed operations. This unit is ideal for achieving accurate and constant speed of the cylinder, intermediate stopping, skip movement, or for slow operation of a rotary actuator.

A selection of valve unit is available to suit your application.

Although the converter and the valve unit are integrated, they can also be operated by connecting individual piping.

High cylinder driving speed.

Through the availability of a wide range of series in terms of converter capacity and valve unit flow rate control capability, speed as high as 200 mm/s (throttle valve) can be achieved with a ø80 cylinder.
(Operating pressure: 0.5 MPa, unloaded,
Piping: Bore 19 mm x 1 m)

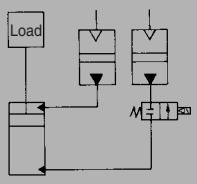
Air-hydro Unit
Series CC

Air-hydro Converter
Series CCT

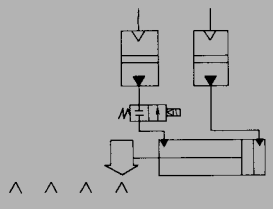
Valve Unit
Series CCVS/CCVL

Application Example

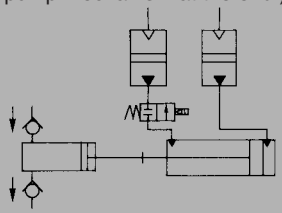
1. Function of stop valve
Prevents load dropping (In an emergency)



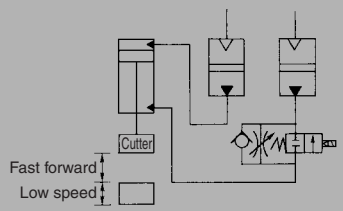
Multipoint intermediate stops



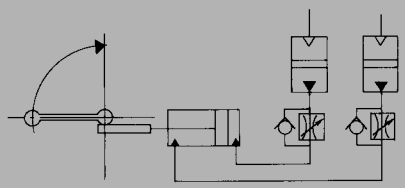
Fixed end point
(Not only solid but also liquid is available if there is pump mechanism at the end.)



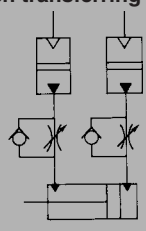
2. Function of skip valve
Fast forward to working process



3. Flow control valve (With pressure compensation)
Uniform driving for load fluctuations



4. Throttle valve/Speed controller
- **Working without jumping at low speeds or when starting.**
- **Control with throttle valve and speed controller when transferring and carrying.**



Air-hydro Unit
Handling Precautions
Be sure to read before handling.

Selection Step

Step (1) Select the bore size of air-hydro cylinder

First of all, select a bore size from data (D) <Theoretical Output Table>. When making a selection, the ratio between the theoretical output and the load should be 0.5 or less.

Step (2) Select converter

Select the nominal diameter and the effective oil level stroke from data (A), <Cylinder Displacement and Converter Capacity Diagram>. When selecting a converter by its nominal diameter, the converter's oil level speed should be 0.2 m/s or less.

Step (3) Select required function for valve unit

Select a model from data (B), <Converter and Valve Unit Combinations and Applications Table> by determining the functions that are needed for the valve unit in accordance with your application.

Step (4) Select the size of valve unit

Using data (C), <Air-Hydro Cylinder's Maximum Operating Speed> as a reference, select the size of a valve unit by determining whether it meets the desired cylinder operating speed.

* The model of an air-hydro unit that is suitable for a particular application is determined by the combination of the converter that was selected in steps (1) and (2), and the valve unit that was selected in steps (3) and (4). For details on how the models are indicated, refer to "How to Order".

Caution on Selection

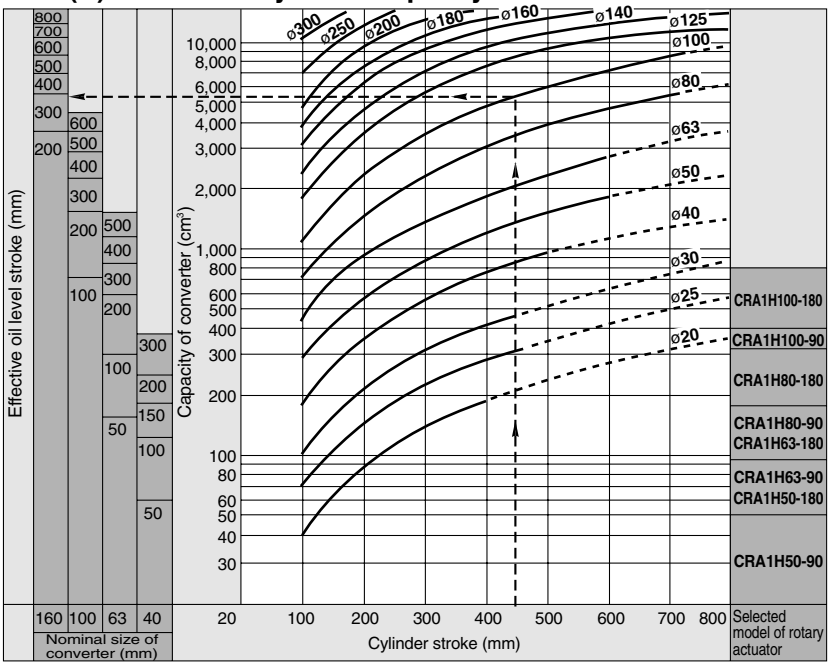
1. Make sure to select a cylinder and a rotary actuator for an air-hydro operation. Do not use these for pneumatic operations because they will lead to oil leaks.

Air-hydro cylinder: CA1□H□-□
CQ2□H□-□
CS1□H□-□
CM2□H□-□
CG1□H□-□ (up to ø63)
HC03-X1-□ x □□

Air-hydro rotary actuator:
CRA1H□-□

2. When determining the size of a converter based on the <Cylinder Displacement and Converter Capacity Diagram>, do not select a converter bore that is too small for the cylinder's bore size because this will increase the oil level speed, causing the oil to blow out. Thus, select a converter bore, so that the oil level speed will be 200 mm/s or less.

Data (A) Volume of Cylinder/Capacity of Converter



How to read the graph (ex: when using a ø100 to 450 st cylinder): Draw a line perpendicularly from the cylinder stroke of 450 to the point at which it intersects the (curve) cylinder bore size of ø100, and extend it to the left to obtain the displacement of approximately 5,300 cm³. Then, select a converter with a larger capacity. The converter will be ø160 to 300. To obtain the capacity of the converter, multiply the cylinder displacement by approximately 1.5.
Note) Select the nominal diameter of the converter so that the converter's oil level speed does not exceed 0.2 m/s.

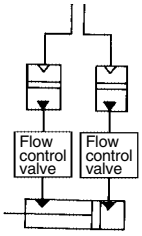
Data (B) Combination of Converter and Valve Unit/Operating Purpose

Combined valve \ Control valve	Without control valve	Throttle valve	Flow control valve (With pressure compensation)	Operating purpose
Without stop valve Without skip valve				In case only speed control is needed.
Stop valve				Intermediate stops, step feed, emergency stops, and stop for service are possible.
Skip valve				Double speed change is possible. (Fast forward, Uniform speed delivery)
With stop valve With skip valve				Intermediate stops, step feed, emergency stops, stops for service, double speed change are possible.
Operating purpose	For applications that do not require speed control, as long as objects are moved smoothly. Or for applications in which a pneumatic speed controller suffices. (3 dm³/min or more)	For applications that require a crawl speed control (0.3 dm³/min or more), provided that fluctuations caused by operating pressures and loads are permissible.	For applications that require a crawl speed fluctuation control (0.04 to 0.06 dm³/min or more), and require an almost constant speed even when the operating pressure or the load fluctuates.	

Data (C) Maximum Driving Speed of Valve Unit and Cylinder

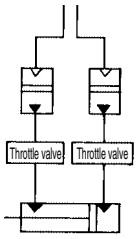
Cylinder driving speed when operating flow control valve

Condition: Operating press.: 0.3 to 0.7 MPa
Load ratio: 50% or less
Operating oil: Additive turbine oil Class 1 (ISO VG32)
Oil piping length: 1 m



Cylinder driving speed when operating throttle valve

Condition: Operating press.: 0.5 MPa
Operating oil: Additive turbine oil Class 1 (ISO VG32)
Oil piping length: 1 m



Cylinder driving speed when operating stop valve

Condition: Operating press.: 0.5 MPa
Operating oil: Additive turbine oil Class 1 (ISO VG32)
Oil piping length: 1 m

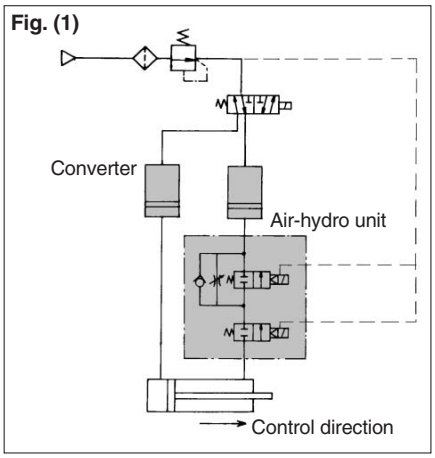
Caution on Circuit Construction

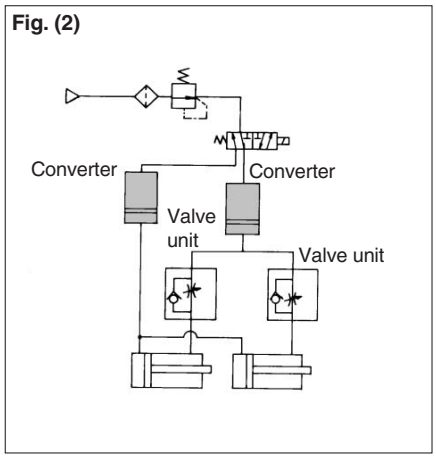
1. The converter's oil level must be properly maintained because a slight oil leak from the sliding of the seal of the air-hydro cylinder can not be avoided.
2. Make sure to install an exhaust cleaner (Series AMC) on the direction switching valve.
3. Within the reciprocating movement of the actuator, if only the movement in one direction must be controlled, connect an air-hydro unit to the cylinder piping port of the control direction as shown in Fig. (1).

Fig. (1)



4. To operate (without synchronizing) two or more actuators with a single converter, use a valve unit with individual cylinders as shown in Fig. (2). The actuators will operate starting with the one that is the easiest to operate.

Fig. (2)



[Synchronized operation]
It is practically impossible to completely synchronize the operation of two or more cylinders. Therefore, a mechanical device must be used for regulating the operation of individual cylinders. The mechanical device must provide a level of rigidity that is appropriate for the cylinder thrust. If it lacks rigidity, it could apply an unbalanced load on the cylinders, leading to a considerable reduction in the durability of the cylinders.

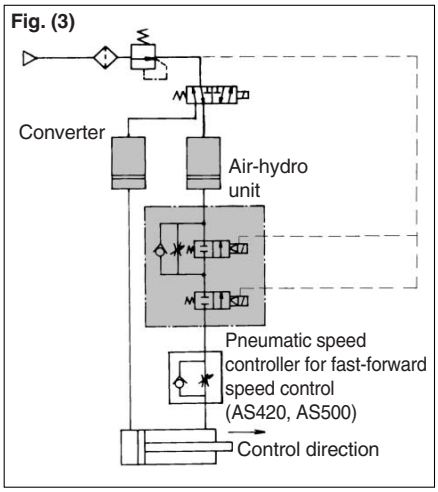
Caution on Circuit Construction

Skip valve

1. When using a skip valve, the maximum allowable ratio between the high speed and the low speed is approximately 3:1. If this ratio is too large, air bubbles could form due to cavitation, and air bubble could lead to the conditions described in the single-side hydro pages 1), 2), 3), and 4) of the "Cautions/Common Precautions".

2. If the skip valve of an air-hydro unit with skip valve is operated, because it is not equipped with a speed control valve, the fast-forward speed will be determined by the model, piping conditions, and the actuator used. In this case, the cylinder could operate at extremely high speeds if the cylinder bore size is small. If it is necessary to control the fast forward speed, use a pneumatic speed controller as shown in Fig. (3).

Fig. (3)



Stop valve

1. Operate the stop valve under meter-out control.

2. If the movement must be stopped at an intermediate position in both directions through the use of a stop valve, make sure to provide a stop valve for both the head side and the rod side.

3. If the cylinder is operated facing up, when the stop valve that is provided on the rod side is closed, the piston rod could descend when the pressure on the head side is turned to zero. To prevent this, a stop valve must also be provided on the head side.

4. Because the stop valve uses a metal seal, it has a slight leak. Due to this leakage, the cylinder could move in the amount that is shown in the diagram, after making an intermediate stop.

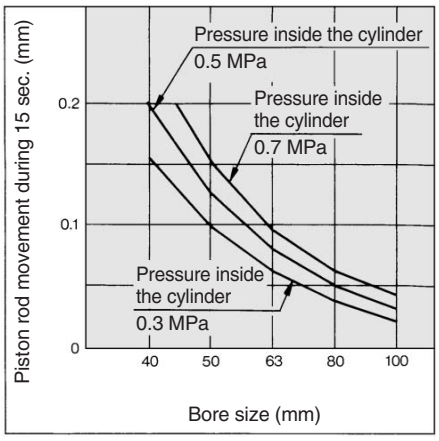


Fig. (4)

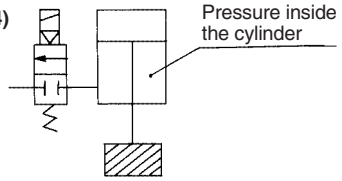


5. For response time of stop valve, refer to the list below.

Model	Response time
CCVS	0.07 ± 0.015 sec.
CCVL	0.11 ± 0.02 sec.

Intermediate stop accuracy of CCVS:
50 mm/s x ±0.015 sec. = ±0.75 mm in case of 50 mm/s

Surge pressure

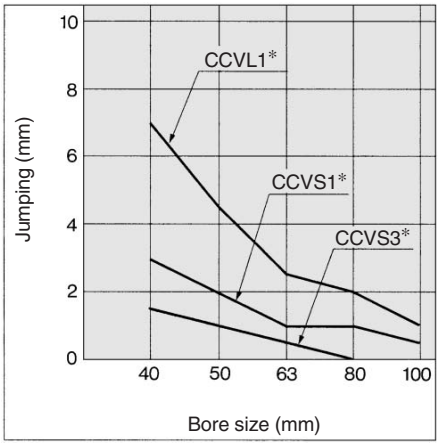
● When the cylinder is operated at high speeds and reaches the stroke end, surge pressure could be created in the rod side or in the head side. At this time, if the stop valve of the rod side or the head side is closed, the surge pressure could become sealed in, preventing the stop valve from operating. This can be solved by closing the stop value 1 to 2 seconds later.

Temperature rise

● When the cylinder is stopped at the stroke end, a speed control valve located opposite to the stroke end (which is the stop valve on the rod cover during retraction, and the stop valve on the head cover during extension) remains closed, the cylinder's internal pressure could increase with temperature, preventing the stop valve from opening. Therefore, do not close the stop valve in this condition.

Jumping of pressure compensating mechanism

● Be aware that the amount of jumping that is shown in Graph 5 applies to the pressure compensation mechanism during the operation of the cylinder. "Jumping" is a condition in which the cylinder operates without control at a speed that is higher than the control speed.



Graph 5

Air-hydro Unit
Precautions

Be sure to read before handling. Refer to pages 10-24-3 to 10-24-6 for Safety Instructions and Actuator Precautions on the products mentioned in this catalog, and refer to main text for more detailed precautions on every series.

Air Supply

- A mist separator prevents the intermixing of drainage, preventing the air-hydro unit from malfunctioning, and prolonging the life of the oil.

Environment

- Avoid use near fire.
- It cannot be used in the clean room.

Mounting

- Install the converter vertically.
- Install the converter at a position that is higher than the cylinder. If placed lower than the cylinder, air accumulates in the cylinder. Use the air bleed valve on the cylinder to bleed the air. If the cylinder is not provided with an air bleed valve, loosen the hydraulic pipe to bleed.
- Leakage associated with the sliding movement inevitably occurs. In particular, with the single side hydro unit, the operating oil that leaks to the pneumatic side will be discharged from the switching valve, thus soiling the switching valve. Thus, install an exhaust cleaner (Series AMC). (Fig. (6))
  When the oil case of the exhaust cleaner becomes full, operating oil will blow out of the exhaust cleaner. Therefore, open the drain valve on a regular basis.

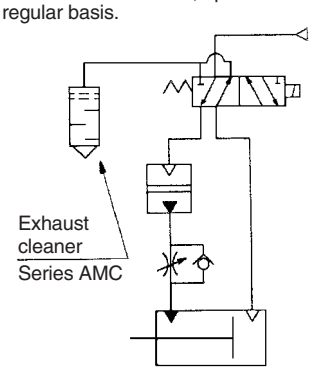


Fig. (6)

Piping

- Before connecting the pipes, remove any foreign matter.
- The {T Series W (white)} nylon tube can be used for hydraulic piping. Self-aligning fittings can be used for hydraulic piping, but one-touch fittings cannot be used.
- Make sure that there are no extreme differences in the bore of the pipes used for hydraulic piping. Also check for protrusions or burrs.
- Prevent air from being drawn into the hydraulic piping.
- When operating a stop valve or a skip valve with a solenoid valve, considering it is an external pilot, provide pneumatic piping with 0.3 to 0.7 MPa of air pressure. The pressure for the pilot must be set to the operating pressure of the cylinder or higher.
- When operating a stop valve or a skip valve with a solenoid valve, considering it is an external pilot, provide pneumatic piping with 0.3 to 0.7 MPa of air pressure. The pressure for the pilot must be set to the operating pressure of the cylinder or higher.
- The stop and skip valves must be “normally closed”.

Piping

- Be aware that the specified speed might not be attained if there is restriction in the fittings or there are 90° bends.
- Air bubbles could form during operation due to cavitation. To prevent this:
  1) Configure the piping from the cylinder to the converter to have an ascending gradient.
  2) Shorten the hydraulic piping.

Maintenance

Double-side hydro

- Even as a double side hydro unit, leakage occurs with the sliding movement of the air-hydro cylinder, increasing the converter's operating fluid in one area and decreasing it in the other. Fig. (7) provides a countermeasure circuit. Maintain the converter’s oil level at an appropriate level by opening valve A.

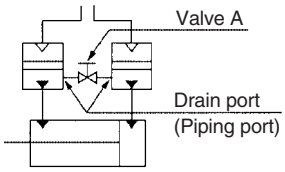

Fig. (7)

Single-side hydro

- The basic composition of the air-hydro system is the double side hydro; however, it can also be used as a single side hydro. The viscosity of the operating oil of the single side hydro is approximately one half of the double side hydro. The speed will be approximately 1.4 times the date given on page 10-17-3. When the system is used as a single side hydro, air could become intermixed with the operating oil, leading to the symptoms listed below:
  1) Cylinder’s speed is not constant.
  2) Stopping accuracy of the stop valve decreases.
  3) Overrun of the skip valve increases.
  4) The flow control valve with pressure compensator knocks (even with a small flow rate).

Therefore, it is necessary to check periodically to prevent air from intermixing with the oil. If the symptoms described above occur, air must be bled. In particular, to prevent “4)”, use a double side hydro.

Lubrication

If the converter is positioned higher than the cylinder:

1. Make sure to move the cylinder’s piston to the stroke end of the side that will be filled with oil.
2. Open the air bleeder valve on top of the cylinder.
3. If equipped with a stop valve, provide a pilot pressure of approximately 0.2 MPa to the stop valve, and maintain the stop valve in an open position through manual operation or by applying current.
4. Open the oil filler plug to fill with oil. When air no longer comes out intermixed with oil, close the cylinder’s air bleeder valve. Make sure that the oil level is near the upper limit mark on the level gauge, and replenish with oil if needed.
5. Next, fill the opposite side with oil. Move the piston to the stroke end of the side that will be filled with oil, and perform steps 1 through 4 in the same sequence as described above.

If the converter is positioned lower than the cylinder:

After filling with oil as described in step 4 above, close the oil filler plug. Then, introduce air pressure of approximately 0.05 MPa into the converter’s air port to push the oil into the cylinder. When air no longer comes out intermixed with oil, close the cylinder’s air bleeder valve.
Perform the remaining steps in the same way as when the converter is located higher than the cylinder, in order to fill it with oil.

* This operation necessarily causes air to accumulate in the cylinder during the operation of the cylinder. Therefore, air must be bled on a regular basis.

Fluid (Hydraulic fluid)

Use petroleum based turbine hydraulic operating oil. The use of non-combustible operating oil could lead to problems.
An appropriate viscosity is about 40 to 100 mm²/s at the operating temperature.
Using ISO VG32 oil, the temperature range will be between 15 and 35°C.
To operate in a temperature range that exceeds that of the ISO VG32 oil, use ISO VG46 (25 to 45°C).

Turbine oil of ISO VG32
(Example)
<No additive>
Idemitsu Kosan Co., Ltd.: Turbine oil P32
Nippon Mitsubishi Oil Corp.:
Turbine oil 32, Mitsubishi turbine 32
Maruzen: Turbine oil 32
<Additive>
Idemitsu Kosan Co., Ltd.: Dufny turbine oil 32
Nippon Mitsubishi Oil Corp.:
FBK turbine 32, Diamond turbine oil 32
Maruzen: Turbine super 32

Air-hydro Unit
Series CC

The air-hydro unit consists of a converter and a valve unit that are compactly integrated. It converts air pressure to an equivalent hydraulic pressure, and this hydraulic pressure is used for operating an actuator, thus solving the problem that is associated with the compression characteristics of air. Thus, in spite of using pneumatic equipment, it performs similarly to a hydraulic unit, operating at a constant speed during starting or in the presence of load fluctuations, and at the same time solving the problems of sticking and slipping associated with low speed operations. This unit is ideal for achieving accurate and constant speed of the cylinder, intermediate stopping, skip movement, or for slow operation of a rotary actuator.

A selection of valve unit is available to suit your application.

High cylinder driving speed.
Through the availability of a wide range of series in terms of converter capacity and valve unit flow rate control capability, speed as high as 200 mm/s (throttle valve) can be achieved with a ø80 cylinder.
(Operating pressure: 0.5 MPa, unloaded, Piping: Bore 19 mm x 1 m)

Although the converter and the valve unit are integrated, they can also be operated by providing individual piping.

CAD

Valve Unit
Series CCVS/CCVL

How to Order

CCV **S** **1** **1** — **1** **[ ]** — **U1**

Valve unit size

S	Small flow
L	Large flow

Control valve

0	None
1	Flow control valve (With pressure compensation)
2	Throttle valve
3	Timid flow control valve (Series CCVS only)

Combined valve

0*	None
1	Stop valve + Skip valve
2	Stop valve
3	Skip valve

* For the one without combined valve (0), solenoid valve does not come with.
<Example> CCVS10-U1

Solenoid valve rated voltage

Nil	No combined valve
1	100 VAC (50/60 Hz)
2	200 VAC (50/60 Hz)
5	24 VDC
9*	Other
0	Air operated

* Option

Electrical entry of solenoid valve

Nil	Air operated
G	Grommet
C	Conduit
D	DIN terminal

Suffix

S	Single valve
U_1	Unit for CC63 (Unit mounted to CCT63)
U_2	Unit for CC100 and CC160 (Unit mounted to CCT100 and 160)

Specifications

Specifications		Combined valve		Control valve				
		Stop valve, Skip valve		Throttle valve		Flow control valve		
		Small flow	Large flow	Small flow	Large flow	Timid flow	Small flow	Large flow
Operating pressure		0 to 0.7 MPa		0 to 0.7 MPa		0.3 to 0.7 MPa		
External pilot pressure		0.3 to 0.7 MPa		—		—		
Proof pressure		1.05 MPa						
Ambient & Fluid temperature		5 to 50°C						
Fluid		Turbine oil (40 to 100 mm²/s)						
Effective area (mm^2)	Stop valve, Skip valve	40	88	—				
	Control valve free open	—		35	77	18	24	60
	Control valve free flow	—		30	80	23	30	80
Minimum control flow (dm^3/min)		—		0.3		0.04	0.06	
Pressure compensating ability		—		—		±10%		
Pressure compensating range		—		—		Load ratio: 60% compared to theoretical output		
Valve type		N.C.		—		—		

Solenoid Valve Specifications of Combined Valve (Stop valve/Skip valve)

Solenoid valve model		V0301-00-**	
External pilot pressure		0.3 to 1.0 MPa	
Rated voltage	Standard	100/200 VAC, 24 VDC	
	Option	110/220 VAC, 6/12/48/100 VDC	
Apparent power	AC	Start-up	50 Hz: 14 VA 60 Hz: 13 VA
		Holding	50 Hz: 9 VA 60 Hz: 8 VA
	DC	6.5 W	
Electrical entry		Grommet (Standard), Conduit, DIN terminal	

Applicable Converter

Valve unit	Nominal size (mm)
Small flow	63, 100
Large flow	100, 160

Solenoid Valve Function Plate

Solenoid valve type		N.C.*	N.O.**
Valve type	Stop valve	CL	OP
	Skip valve	OP	CL

* Valve opens when solenoid valve conducts electricity.
** Valve opens when solenoid valve stops conducting electricity.

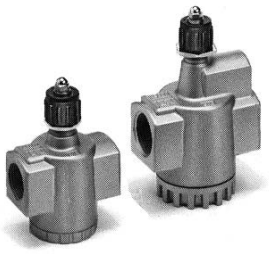
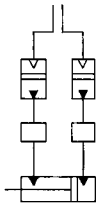
* Pitch of mounting on the wall is CA and CL.

If intricate speed control is unnecessary and the changes in speed due to load fluctuations can be tolerated, the pneumatic speed controller can be used as a control valve.
The minimum controllable flow volume of the speed controller is 3 dm³/min.
The speed controller and the converter must have individual pipe connections. They cannot be integrated into a unit.



Circuit diagram



Speed controller

Maximum Driving Speed of Cylinders (Speed controller)

Conditions: Operating pressure — 0.5 MPa, Operating oil — Turbine oil Class 1 (ISO VG32), Piping length — 1 m

Product Profile:
Hydraulic Cylinders: *Series CH*

Compact hydraulic cylinder conforming to JIS
Series CHKDB

Compact hydraulic cylinder
Series CHKGB

- Light and compact alminum body
- Auto switch can be mounted.
- Auto switch mounting doesn't affect overall length
- A wide range of operating pressures, bore sizes, and standard strokes make wide selections possible.

CHKDB

CHKGB

For details, refer to the catalog CAT. E111.

Series	Bore size (mm)	Stroke (mm)	Action	Fluid	Nominal pressure (MPa)	
					CHKDB	CHKGB
CHKDB CHKGB	20	5, 10, 15, 20, 25, 30 35, 40, 45, 50	Double acting, Single rod	Hydraulic fluid (Standard mineral hydraulic fluid W/O hydraulic fluid O/W hydraulic fluid)	10	16
	25					
	32	5, 10, 15, 20, 25, 30 35, 40, 45, 50, 75				
	40	5, 10, 15, 20, 25, 30 35, 40, 45, 50, 75 100				
	50					
	63					
	80					
	100					

Compact hydraulic cylinder Double acting, single rod
Series CHQB

Compact hydraulic cylinder Double acting, double rod
Series CHQWB

- 3.5 MPa hydraulic cylinder with short overall length
- Makes more compact jigs and equipment a reality
- Auto switch can be mounted.
- Auto switch mounting doesn't affect overall length.

CHQB

CHQWB

For details, refer to the catalog CAT. E111.

Series	Bore size (mm)	Stroke (mm)	Action		Fluid	Nominal pressure (MPa)
			CHQB	CHQWB		
CHQB CHQWB	20	5, 10, 15, 20, 25, 30 35, 40, 45, 50	Double acting, Single rod	Double acting, Double rod	Hydraulic fluid (Standard mineral hydraulic fluid W/O hydraulic fluid O/W hydraulic fluid)	3.5
	32	5, 10, 15, 20, 25, 30 35, 40, 45, 50, 75, 100				
	40

	63					
	80					
	100					

Round type hydraulic cylinder
Series CHN

Stainless tube, 7 MPa hydraulic cylinder of small bore size

CHN

For details, refer to the catalog CAT. E111.

Series	Bore size (mm)	Stroke (mm)		Fluid	Nominal pressure (MPa)
		Standard	Long		
CHN	20	25 to 300	800	Hydraulic fluid (Standard mineral hydraulic fluid W/O hydraulic fluid O/W hydraulic fluid)	7
	25	25 to 400			
	32	25 to 500			
	40				

Series CH

Tie-rod type low pressure cylinder Double acting, single rod
Series CHA
Tie-rod type low pressure cylinder Double acting, double rod
Series CHAW

- Light alminum body
- Aluminum cylinder bore sizes ø40 to ø100 are auto switch capable for easy stroke position detection.
- Cushioning nearly equal to a shock absorber is achieved with a unique cushion ring configuration and cushion seal design.

CHA **CHAW**

For details, refer to the catalog CAT. E111.

Series	Bore size (mm)	Stroke (mm)		Fluid	Nominal pressure (MPa)
		CHA	CHAW		
CHA CHAW	40	25 to 1000	25 to 800	Hydraulic fluid (Standard mineral hydraulic fluid W/O hydraulic fluid O/W hydraulic fluid)	3.5

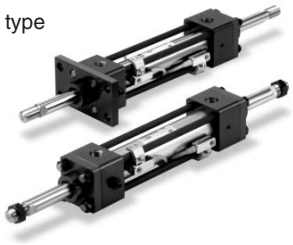
Compact hydraulic cylinder conforming to JIS Double acting, double rod
Series CH2□W

Cushion seal type

CH2□W



For details, refer to the catalog CAT. E111.

Series	Bore size (mm)	Stroke (mm)	Fluid	Nominal pressure (MPa)	
				CH2EW	CH2FW
CH2EW CH2FW	32	25 to 800	Hydraulic fluid (Standard mineral hydraulic fluid W/O hydraulic fluid O/W hydraulic fluid)	3.5	7
	40				
	50				
	63				
	80	25 to 1000			
	100				

Hydraulic cylinder conforming to ISO 10762 (JIS B 8367-5:2002)
Series CHSD

- 10 MPa hydralic cylinder of bore size 40 to 100

Hydraulic cylinder conforming to ISO 6020-2 (JIS B 8367-2:2002)
Series CHSG

- 16 MPa hydralic cylinder of bore size 32 to 100

CHSD **CHSG**

For details, refer to the catalog CAT. ES110-12.

Series	Bore size (mm)	Stroke (mm)	Fluid	Nominal pressure (MPa)
CHSD CHSG	32 (CHSG)	25 to 800	General mineral hydraulic fluid	10 MPa (CHSD) 16 MPa (CHSG)

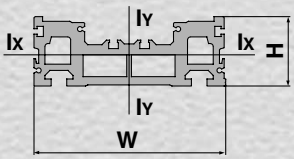
	50			
	63			
	80	25 to 1000		
	100			

Product Profile:
Electric Actuators: *Series LJ1/LG1*

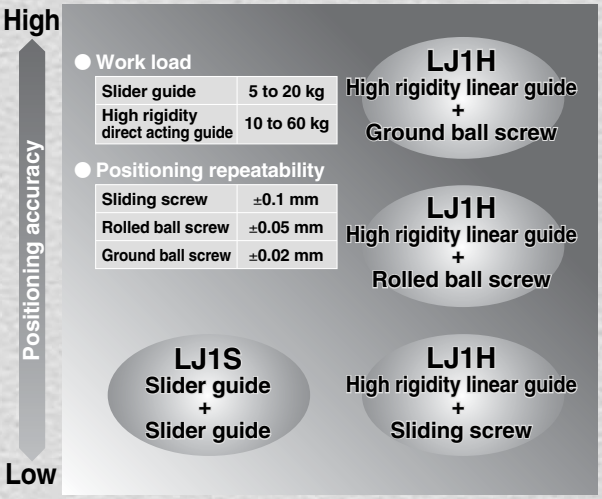
Two types of guide and three types of feed screw

Single Axis Electric Actuator
Series LJ1

High rigidity
High rigidity achieved by the use of a hollow box type aluminum construction



Model		Sectional secondary moment Ix	Sectional secondary moment Iy	W	H
Linear guide	LJ1H10□□	7	48	70	24.7
	LJ1H20□□	40	374	122	44.8
	LJ1H30□□	84	836	151	55
Slider guide	LJ1S10□□	15	52	70	36
	LJ1S20□□	60	402	122	56.3
	LJ1S30□□	177	1000	151	73.3



Low noise (Slide screw type)
Slide screw + Slider guide: **47** dB (LJ1S)
Slide screw + Linear guide: **53** dB (LJ1H)

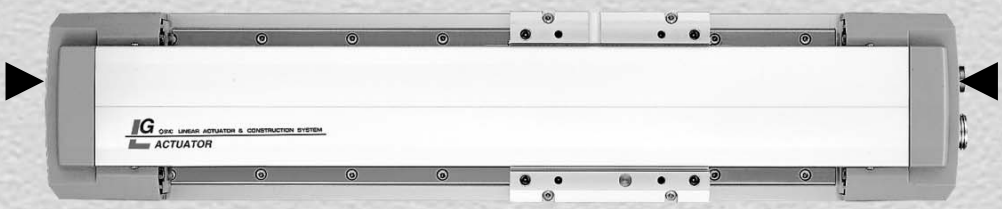
Low profile, non-coupling type with reduced height and length

Compact Electric Actuator
Series LG1

Series with coupling available
Mounting of a non-standard motor is possible.

Low profile: 55 mm (35 mm less than LJ1H20)

Reduced length (62 mm shorter than LJ1H20 with coupling and 300 mm stroke)



Controller
Series LC1

Teaching box

Regenerative absorption unit
Series LC7R

For details, refer to the catalog CAT. E101.

Product Profile:
Electric Actuators: *Series LX*

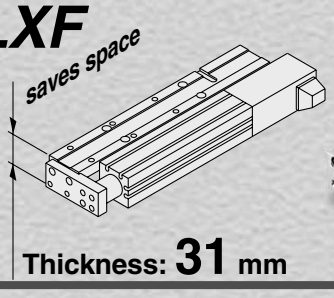
Short stroke type with three guide variations

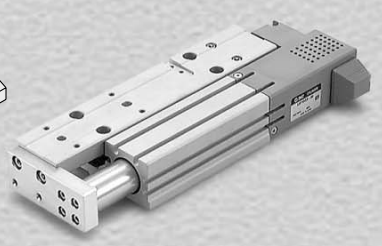
Short Stroke Electric Actuators

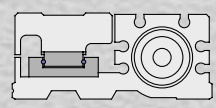
Series LX

High rigidity slide table type with stepper motor

Series LXF

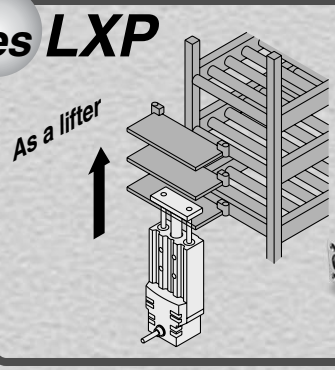


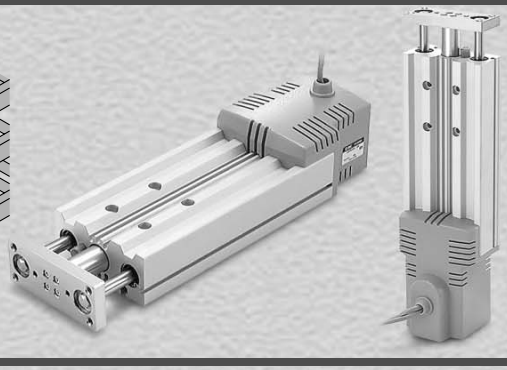


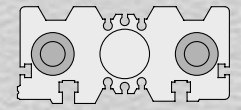


Guide rod type with stepper motor

Series LXP

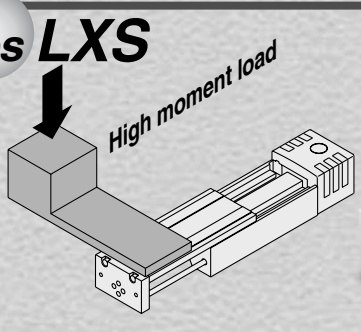


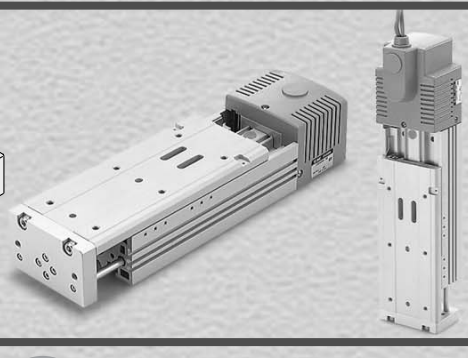


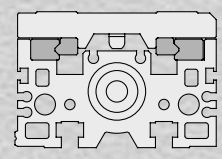


High rigidity slide table type with stepper motor

Series LXS







CE marking available as standard

AC servomotor specifications/Made to order

Series LXF
Series LXP
Series LXS

Driver
Series LC6D

Positioning driver
Series LC6C

Teaching box

For details, refer to the catalog CAT. E101.
